

1 Update: Version 2.0! 🚀

Hi, version 2.0 is here! This is a major update that adds the `highlight` package for new coding features. In particular now text highlighting in coding blocks is done through the `highlight` library. This means that you need to install it in your system to use the new features. This version is retro-compatible with the previous one, so you can still use the previous coding environments as before (indeed the previous sections are just as they were). Additionally I've added a new theme to celebrate this new version, it's called `dark`. I hope you like it!
